

ABSTRACT

5 The invention relates to a swimming pool filter that includes a filter
body (1) being formed by a casing (2) with a top cover (3), and the cover (3)
forms a water distributor (4), this latter being compartmented (6, 7, 8, 9 and
10), upperly open (11) and provided with lateral openings (12, 13, 14 and 15)
for a selected water inflow and outflow, the distributor (4) being closed by a
10 rotatable (24), compartmented (20, 21, 22 and 32) sealing subcover (19). The
subcover (19) is apt to be stabilized in its different positions by means of
peripheral projections (27) being apt to selectively fit into a socket (28) being
integral with the cover (3) in the vicinity of its open top (11). A receiver (32) is
inferiorly fitted to the casing (2) and is made up of a grid-like plate conforming
15 to the periphery of the casing (2).
